-!- FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha,

MIP-1-beta and RANTES and subsequently transduces a signal by

increasing the intracellular calcium ions level. May play a role

in the control of granulocytic lineage proliferation or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-WAY-2000 (Rel. 39, Created)

Sequence evolution of the CCR5 chemokine receptor gene in primates.";

Mol. Biol. Evol. 16:1145-1154(1999).

-!- FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha,

MIP-1-beta and RANTES and subsequently transduces a signal by

increasing the intracellular calcium ions level. May play a role

in the control of granulocytic lineage proliferation or

differentiation.

Latinion of CRS by macrophage and T cell tropic similar immunodeficiency virus strains."; Proc. Natl. Acad. Sci. U.S.A. 94:4005-4010(1997).

- FINCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha, MIP-1-betta and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level. May play a role in the control of granulocytic lineage proliferation or in the control of granulocytic lineage proliferation of differentiation. Subcritical membrane protein. Subcritical integral membrane protein. SIMILARITY: Belongs to family 1 of G-protein coupled receptors. SEQUENCE FROM N.A.

Submitted (NOV-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha,
MIP-1-beta and RAWTES and subsequently transduces a signal by
increasing the intracellular calcium ions level. May play a role
in the control of granulocytic lineage proliferation or
differentiation.

"Sequence evolution of the CCR5 chemokine receptor gene in primates.";
Mol. Biol. Evol. 16:1145-1154(1999).
-!- FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha,
MIP-1-beta and RANTES and subsequently transduces a signal by
increasing the intracellular calcium ions level. May play a role
in the control of granulocytic lineage proliferation or

Biol. 2vol. 16:1145-1154(1999).
-! FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha, MIP-1-bete and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level. May play a role in the control of granulocytic lineage proliferation or

Guo B., Kuno K., Harada A., Matsushima K.;
Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha,
MIP-1-beta and RANTES and subsequently transduces a signal by
increasing the intracellular calcium ions level.
-!- SUBCELULUAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Detected in monocyte/macrophage cell lines,
-the nonhematopoietic cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chemoattractant protein 1) and murine macrophage inflammatory protein lalpha receptors: evidence for two closely linked C-C chemokine receptors on chromosome 9.";
J. Biol. Chem. 271:7551-7558(1996).

Binds to MIP-1-alpha, MIP-1-beta and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level.
-i-SUBGELULAR LOCATION: Integral membrane protein.
-i-SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                STRAIN=Sprague-Dawley;

                    -!- FUNCTION: Receptor for the MCP-1, MCP-3 and MCP-4 chemokines.

Transduces a signal by increasing the intracellular calcium ions level. Alternative coreceptor with CD4 for HIV-1 infection.
-!-SUBCELLULAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                                                                                                                                            PTM: N-glycosylated.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

Mouse astrocytes respond to the chemokines MCP-1 and KC, but reverse transcriptase-polymerase chain reaction does not detect mRNA for the KC or new MCP-1 receptor.";

If I Neurosci. Res. 45:382-391(1996).

II TISSUE SPECIFICITY: Integral membrane protein.

II SUMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Charo I.F., "Monthly and functional expression of murine JE (monocyte "Molecular cloning and functional expression of murine JE (monocyte chemoattractant protein 1) and murine macrophage inflammatory protein receptors: evidence for two closely linked C-C chemokine receptors on chromosome 9.";

"Molecular cloning of cDNAs encoding a LD78 receptor and putative leukocyte chemotactic peptide receptors.";
Int. Immunol. 5:1239-1248 (1993).
-!- FUNCTION: Receptor for a C-C type chemokine. Binds to MIP-1-alpha, MIP-1 delta, RANTES, and MCP-3 and, less efficiently, to MIP-1-beta or MCP-1 and subsequently transduces a signal by increasing the intracellular calcium ions level. Responsible for affecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         stem cell proliferation.
SUBCELLULAR LOCATION: Integral membrane protein.
TISSUB SPECIFICITY: Widely expressed in different hematopoietic
                                                                                              υ,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -1- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7 (POTENTIAL).

"Loss of all ndh genes as determined Pinus thunbergii.";
chloroplast genome of the black pine Pinus thunbergii.";
Proc. Natl: Acad. Sci. U.S., 91:9794-9798(1994).
-!- FUNCTION: DNA-dependent RNA polymerase catalyzes the transcription
of DNA into RNA using the four ribonucleoside triphosphates as
Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -!- SUBINIT: In chloroplasts, the RNA polymerase is composed of four subunits: alpha, beta, beta', and beta'.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- SIMILARITY: Belongs to the RNA polymerase beta chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -!- CATALYIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA}(N).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chloroplast.

1. Immunol. 164:4046-4054(2000).

1. FUNCTON: High affinity receptor for the C-C type chemokines TARC/SCYA17 and MUC/SCYA22. The activity of this receptor is mediated by G(i) proteins which activate a phosphatidylinositol-calcium second messenger system. Can function as a chemoattractant homing receptor on circulating memory lymphocytes and as a coreceptor for some primary HIV-2 isolates. In the CNS, could mediate hippocampal-neuron survival.

1. SUBCELLUIAR LOCATION: Integral membrane protein.

2. PETSUB SPECIFICITY: Predominantly expressed in the thymus, in peripheral blood leukocytes, including T cells, mostly cd4+ cells, and an monocytes. Detected also in macrophages, IL-2-activated natural killer cells and skin-homing memory T cells, mostly the ones expressing the cutaneous lymphocyte antigen (CLA). Expressed in brain microvascular and coronary artery endothelial cells. PHOSPHORYLATION ON YET UNDEFINED SER/PHR REIDUES, MOST PROBABLY BY BESTPURE ADARBATORY RIBER CELLS, SURVAZ BINDING INDUCES.

2. PETM: IN NATURAL KILLER CELLS, SURVAZ BINDING INDUCES.

2. PHOSPHORYLATION ON YET UNDEFINED SER/PHR REIDUES, MOST PROBABLY BY BESTPURE ADARBATORY. IN NATURE STANDING INDUCES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Exp. Med. 1911.1755-1764 (2000).

-!- FUNCTION: High affinity receptor for the C-C type chemokines TARC/SCYA17 and MDC/SCYA2. The activity of this receptor is mediated by G(i) proteins which activate a phosphatidylinositol-calcium second messenger system. Could play a role in lipopolysaccharide (LPS)-induced endotoxic shock. In the CNS, could mediate hippocampal-neuron survival.
-!- SIBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Expressed in the thymus, macrophages and Tyolk sac.
-!- PTH: IN NATURAL KILLER CELLS, SCYA22 BINDING INDUCES
PHOSPHORYLATION ON YET UNDEFINED SER/THR RESIDUES, MOST PROBABLY
BY BETA-ADRENERGIC RECEPTOR KINASES 1 AND 2 (BY SIMILARITY).
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors. (GLCNAC. . .) (POTENTIAL). (GLCNAC. . .) (POTENTIAL). (GLCNAC. . .) (POTENTIAL). CYTOPLASMIC (POTENTIAL).

-!- FUNCTION: THE MUSCARINIC ACETYLCHOLINE RESPRONSES,
CELLULAR RESPONSES, INCLUDING INHIBITION OF POTASSIUM CHANNELS
THROUGH THE ACTION OF PROTEINS. PRIMARY TRANSDUCING EFFECT IS
ADENYLATE CYCLASE INHIBITION.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
     THROUGH THE ACTION OF G PROTEINS. PRIMARY TRANSDUCING EFFECT IS ADENTIFATE CYCLASE INHIBITION.
SUBCELLULAR LOCAFION: Integral membrane protein.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                            InterPro; IPR000276; GPCR_Rhodpsn.

I. SMOOTH MUSCLE RESPONSES, INCLUDING INHIBITION OF PADENYLATE CYCLASE,
BREAKDOWN OF PHOSPHOINOSITIDES & MODULATION OF POTASSIUM CHANNELS
BREAKDOWN OF PROSPHOINOSITIDES & MODULATION OF POTASSIUM CHANNELS
THROUGH THE ACTION OF G PROTEINS. PRIMARY TRANSDUCING EFFECT IS
ADENYLATE CYCLASE INHIBITION.

I. SUBCELLULAR LOCATION: Integral membrane protein coupled receptors.

I. SIMILARITY: Belongs to family 1 of G-protein coupled a collabor.

II is produced through a collabor.
                                                                                                                                     katucus norvegicus (rau).

-!- FUNCTION: Receptor for a C-C type chemokine. Binds to eotaxin, MCP-3 MCP-4 and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level.

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                15-JUL-1998 (Rel. 36, Created)

HUM. RELTOVITURES 17:981-986(2001).
ALDS RES. HUM. RELTOVITURES A C-C TYPE CHEMOKINE. BINDS TO MIP-1-ALPHA, 1-FUNCTION: RECEPTOR FOR A C-C TYPE CHEMOKINE. BINDS TO MIP-1-ALPHA, RANTES, MCP-3 AND, LESS EFFICIENTLY, TO MIP-1-BETA OR MCP-1 AND SUBSEQUENTLY TRANSDUCES A SIGNAL BY INCREASING THE INTRACELLULAR CALCIUM IONS LEVEL. RESPONSIBLE FOR AFFECTING STEM CELL PROLIFERATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    15-UUL-1998 (Rel. 36, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Jaiol. Chem. 265:2828-2834(1990).

-!- FUNCTION: The muscarinic acetylcholine receptor mediates various cellular responses, including inhibition of adenylate cyclase, breakdown of phosphoinositides and modulation of potassium channels through the action of groteins. Primary transducing effect is inhibition of adenylate cyclase. May couple to multiple functional responses in cell lines.
-!- SUBCELDULAR LOGATION: Integral membrane protein.
-!- SIMILARITY: Expressed in heart and brain.
-!- SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

"Cloning and differential tissue-specific expression of three mouse beta chemokine receptor-like genes, including the gene for a functional macrophage inflammatory protein-1 alpha receptor.", J. Biol. Chem. 270:17494-17501(1995).

FINCTION. Receptor for a C-C type chemokine. Binds to ectaxin, MCP-3, MCP-4 and RANTES and subsequently transduces a signal by increasing the intracellular calcium ions level.

SUBCELLULAR LOCATION: Integral membrane protein.

TISSUE SPECIFICITY: Detected in skeletal muscle and in trace amounts in Leukocytes.

SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Molecular characterization of two murine eosinophil beta chemokine

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

These are similar to the human chemoxine receptors CRS, CXCR4 and STRL13, as well as CD4. These are useful in the treatment of HIV, as they prevent replication of the virus. The present sequence is an example of a peptide of the invention

```
The invention relates to nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCR5 or of other chemokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCR5 derived peptides, or compounds derived from the protein of the invention (e.g. antagonist or mutants) that disrupt binding of CCR5 to the protein of the invention would block HIV infection. The present sequence is human chemokine receptor CCR5 C-terminal fragment deletion mutant which is incapable of interacting with the protein of the invention
                                                                                                                                                                                                                                         Nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCR5 isolated from a human B cell cDNA library is useful to detect, treat and prevent HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

with the carboxy terminus of the chemokine receptor CCRS or of other chemokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCRS-derived peptides, or compounds derived from the protein of the invention (e.g. antagonist or mutants) that disrupt binding of CCRS to the protein of the invention would block HIV infection. The present sequence is human chemokine receptor CCRS C-terminal mutant fragment which is incapable of interacting with the protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCRS or of other chemokine receptor family members. Molecules of the invention are used to detect, prevent and treat HIV infection and progression to AIDS. Any CCRS derived peptides, or compounds derived from the protein of the invention and block HIV infection. The present sequence is human chemokine receptor CCRS C-terminal fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid encoding a protein which interacts with the carboxy terminus of the chemokine receptor CCRS isolated from a human B cell cDNA library is useful to detect, treat and prevent HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human CCR5 chemokine receptor C-terminal fragment (residues 295-352).
                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAE14755;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 6
```

```
The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide comprising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assays, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytostatic, antidiabetic, anorectic, cerebroprotective, neuroprotective, antidiammatory; gene therapy, antisenspy, thyronimetic, NOVX; pathology, cancer; diabetes; obesity; endocrine disorder; CNS disorder; inflammatory disorder; chromosome mapping; tissue typing;
                                                                                                                    New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory or CNS diseases.

New isolated NOVX polypeptides and nucleic acid molecules useful for treating, preventing and diagnosing pathological conditions with NOVX-associated disorders, such as cancer, obesity, diabetes and inflammatory CNS diseases

Claim 1; SEQ ID NO 164; 772pp; English.

The invention relates to novel isolated polypeptides, mature form of the polypeptide, a sequence that is 95% identical to the polypeptide or the polypeptide compirising one or more conservative substitutions. The NOVX polypeptide is useful for treating or preventing a pathology associated with the polypeptide e.g. disorders associated with aberrant expression or activity of the polypeptide, such as cancer, diabetes, obesity, and endocrine, CNS and inflammatory disorders. They can also be used in various detection and screening assay, chromosome mapping, tissue typing and predictive medicine. This sequence corresponds to one of the polypeptides of the invention
